A 3D schematic diagram of the EIC Crystal Calorimeter. The diagram shows a central cylindrical structure with a red core and a green outer layer, surrounded by a blue cylindrical shell. The entire assembly is enclosed within a larger, multi-layered structure with a green and blue grid pattern. A red line passes through the center of the structure.

Clustering in the EIC Crystal Calorimeter

Initial Report: 3/24/15

EIC: Location and Design

EIC: Location and Design

- Current implementation is simplified
 - Starting z-position: -99.0 cm
 - Thickness: 18 cm
 - Material: PbWO_4
- Currently split into 5 sections via `RawTowerBuilderCone()` depending on ' η '
 - $-1.2 \leq \eta \leq -4.5$

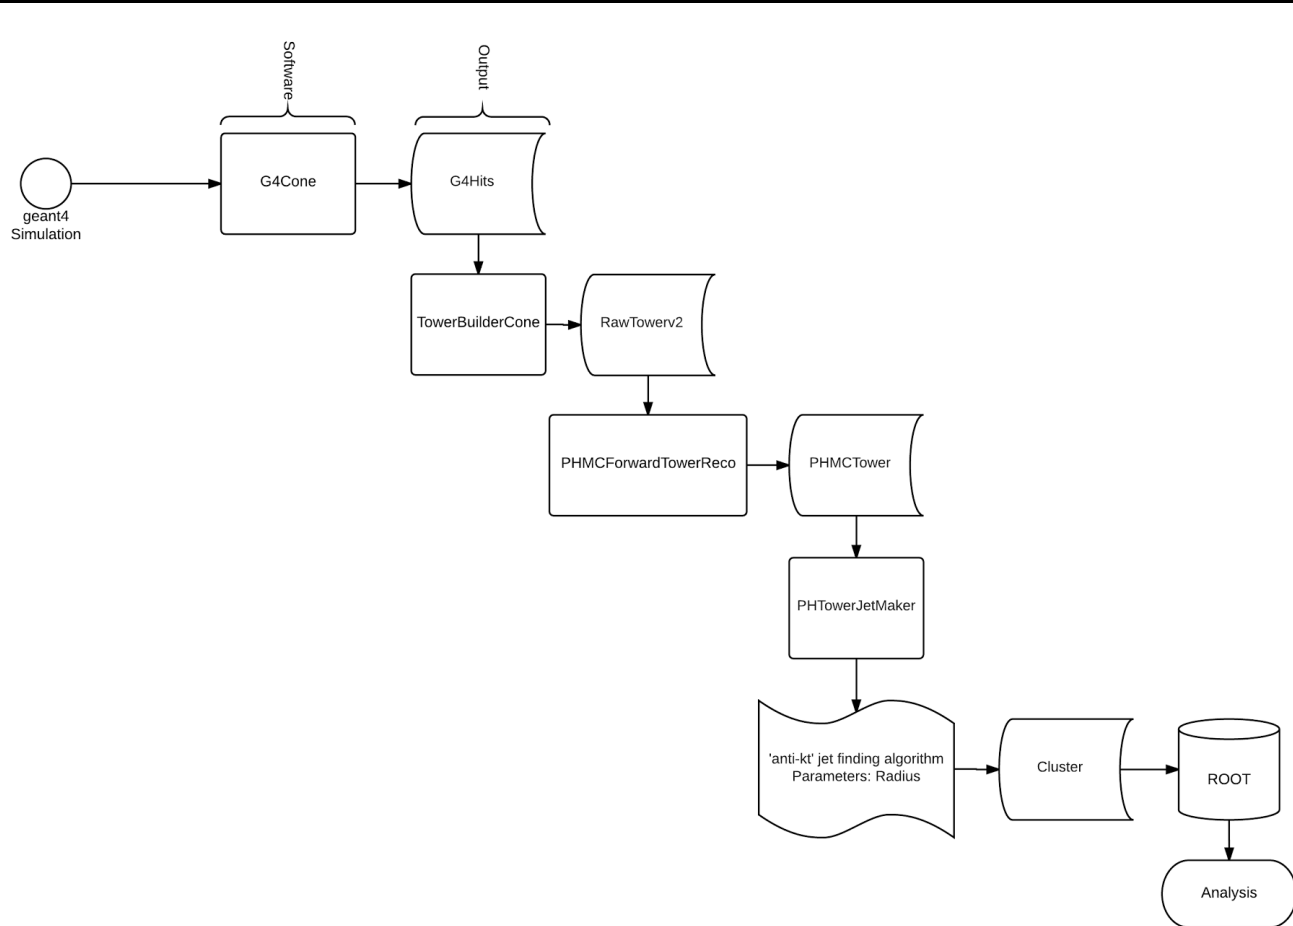

EIC: Location and Design

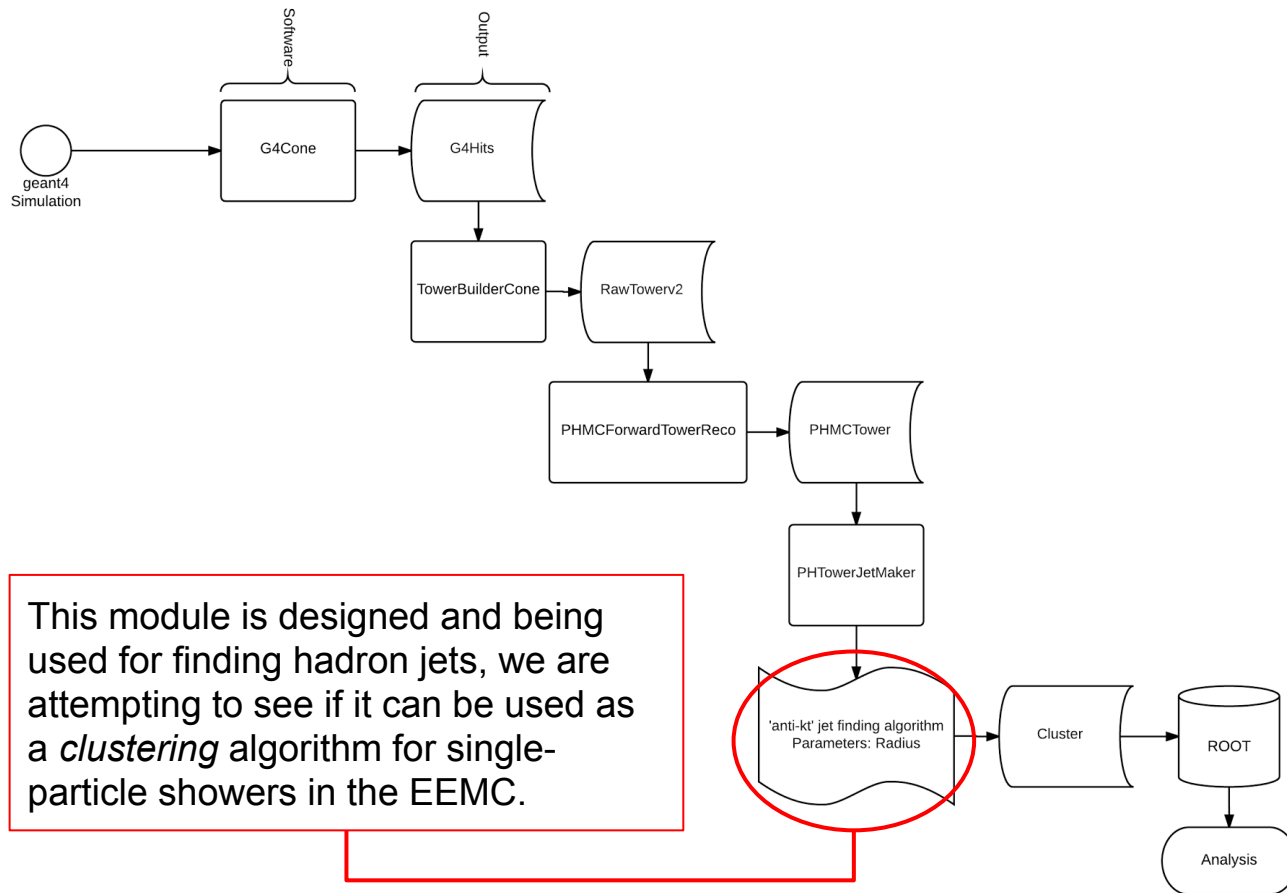

- Main purpose: Identify electrons and measure electron energy and angle for Deep Inelastic Scattering measurements.

Software Flow

Cluster Calculation

Number of clusters determined by the algorithm for 3 different R-parameters

Fraction of events with exactly 1 cluster as function of radius parameter

Energy per Cluster

Example histograms of measured cluster energy -- Normalized

Eta of the Calculated Clusters

Example histograms of measured cluster η .

Eta of the Calculated Clusters

Example histograms of measured cluster η .

30 GeV

Energy and η for those clusters with maximum energy

Summary

- 'anti-kt' algorithm seems promising for single particle showers
- Need to do additional studies to see if it will scale to true Deep Inelastic Scattering events
